Galactic Spacefarer Adventure

In the far reaches of the SAP-verse, you've been tasked with developing the Galactic Spacefarer Adventure System. In this cosmic realm, the spacefarers are on a journey through the SAP galaxy. Your mission is to create a List Report and Object Page Fiori application using SAP CAP, incorporating cosmic custom events in the Service API call when a new spacefaring candidate embarks on their adventure.

Task 1 – Spacefarer Data Model

Define a data model for the Spacefarer entity, including cosmic fields like stardust collection, wormhole navigation skill, origin planet, and spacesuit color. Imagine relationships with intergalactic departments and positions.

Task 2 – Cosmic Service Definition

Create a CAP service definition for the Galactic Spacefarer entity. Include CRUD operations, and make sure that the service is protected from cosmic invaders.

Task 3 – Cosmic Event Handlers

Implement the following cosmic event handlers using the @Before and @After events in the service definition when a new spacefaring candidate is created:

- @Before event: Prepare the spacefaring candidate for their cosmic journey by validating and enhancing their stardust collection and wormhole navigation skills.
- @After event: After a successful launch, send a cosmic notification email to the newly created spacefarer, congratulating them on starting their adventurous journey among the stars.

Task 4 – Galactic List Report Fiori Application

Create a List Report Fiori application that displays a list of all galactic spacefarers with their stardust collection status and spacesuit color. Ensure that the application supports sorting, filtering, and pagination across the SAP galaxy.

Task 5 – Galactic Object Page Fiori Application

Extend the Fiori application to include a Cosmic Object Page that provides detailed information about a selected spacefarer. This page should allow users to edit cosmic details like stardust collection and spacesuit color.

Additional information

- Use the SAP SQLite star cluster as the database for local development.
- In real-time, only authorized users should be able to access the application. Also, users from Planet X must not get access to spacefarers' data from Planet Y.
- Check out the "SAP Fiori Tools - Application Modeler" VS Code extension as it might help you with creating the UI of the application.
- Host a GitHub repository to store and version control your Galactic Adventure Project.

Feel free to take advantage of your creativity with the Data Model and Service Definition for the Spacefarers. Good luck on your Galactic Adventure! 🚀
